**Proposition 1.1.** [Gou, Prop. 5.1.4] Let  $b_{ij} \in \mathbb{Q}_p$  and suppose  $\forall i : \lim_{j \rightarrow \infty} b_{ij} = 0$  and  $\lim_{i \rightarrow \infty} b_{ij} = 0$  uniformly in  $j$ , then both series  $\sum_{i=0}^{\infty} \left( \sum_{j=0}^{\infty} b_{ij} \right)$  and  $\sum_{j=0}^{\infty} \left( \sum_{i=0}^{\infty} b_{ij} \right)$  converge and have equal sum.

## 2 Strassman's Theorem

**Remark 2.1.** Let  $(R, +, \cdot)$  be a ring,  $x, y \in R$ , then we have  $x^n - y^n = (x - y) \sum_{j=0}^{n-1} x^j y^{n-1-j}$ ,  $\forall n \in \mathbb{N}_0$

*Proof.* , we use induction on  $n$ , Base case:  $n = 2$ , it's easy to see that

$$(x - y) \sum_{j=0}^{n-1} x^j y^{n-1-j} = (x - y)(x + y) = x^2 - y^2$$

Induction hypothesis: we assume for an arbitrary  $n \geq 2$  :  $x^n - y^n = (x - y) \sum_{j=0}^{n-1} x^j y^{n-1-j}$ ,  
Induction step: consider

$$\begin{aligned} (x - y) \sum_{j=0}^n x^j y^{n-j} &= (x - y)(y^n + y^{n-1}x + \cdots + x^{n-1}y + x^n) \\ &= (x - y)(y(y^{n-1} + y^{n-2}x + \cdots + yx^{n-2} + x^{n-1}) + x^n) = y(x - y) \underbrace{\sum_{j=0}^{n-1} x^j y^{n-1-j}}_{=x^n - y^n} + x^n(x - y) \\ &= y(x^n - y^n) + x^n(x - y) = yx^n - y^{n+1} + x^{n+1} - yx^n = x^{n+1} - y^{n+1}. \end{aligned}$$

□

**Lemma 2.2.** Let  $f(X) \in \mathbb{Q}_p[[X]]$  be a non-zero power series which converges  $\forall x \in \mathbb{Z}_p$ , then  $\exists N \in \mathbb{N}_0$  such that  $|a_N| = \max_{n \in \mathbb{N}_0} |a_n|$  and  $|a_n| < |a_N| \forall n > N$

*Proof.* Since  $f(X)$  converges  $\forall x \in \mathbb{Z}_p$ , then we have

$$\forall x \in \mathbb{Z}_p : \lim_{n \rightarrow \infty} |a_n x^n| = 0 = \lim_{n \rightarrow \infty} |a_n| \cdot |x^n| \implies \lim_{n \rightarrow \infty} |a_n| = 0$$

□

**Theorem 2.3** (Strassman). Let  $f(X) \in \mathbb{Q}_p[[X]]$  and suppose we have  $\lim_{n \rightarrow \infty} a_n = 0$ , so that  $f(x)$  converges  $\forall x \in \mathbb{Z}_p$ . Define  $N \in \mathbb{N}_0$  like in Lemma 2.2 then the function  $f$  has at most  $N$  zeros.

*Proof.* induction on  $N$ .

- Base case: if  $N = 0$ , then  $|a_0| > |a_n|, \forall n \geq 1$ , we want to show that there are no zeros:  $f(x) \neq 0 \forall x \in \mathbb{Z}_p$ , if we had  $f(x) = 0$ , then

$$\begin{aligned} 0 &= f(x) = a_0 + a_1x + a_2x^2 + \cdots \\ \implies |a_0| &= |a_1x + a_2x^2 + \cdots| \leq \max_{n \geq 1} |a_n x^n| \leq \max_{n \geq 1} |a_n| \end{aligned}$$

But this contradicts the assumption that  $|a_0| > |a_n|, \forall n \geq 1$ , so there are no zeros in this case.

- Induction step: Suppose  $N$  was defined like before, and  $\exists \alpha \in \mathbb{Z}_p : f(\alpha) = 0$ , then we have for any  $x \in \mathbb{Z}_p$

$$\begin{aligned} f(x) &= f(x) - f(\alpha) = \sum_{n=0}^{\infty} a_n x^n - \sum_{n=0}^{\infty} a_n \alpha^n = \sum_{n=0}^{\infty} a_n (x^n - \alpha^n) \stackrel{2.1}{=} (x - \alpha) \sum_{n=0}^{\infty} \sum_{j=0}^{n-1} a_n x^j \alpha^{n-1-j} \\ &= (x - \alpha) \sum_{n=0}^{\infty} \sum_{j=0}^{\infty} c_{nj}, \quad c_{nj} := \begin{cases} a_n x^j \alpha^{n-1-j} & j < n, \\ 0 & j \geq n. \end{cases} \end{aligned}$$

We can use prop 1.1 to change the order of the summation but first we have to show the conditions of the proposition:

1.  $\forall n \in \mathbb{N}_0, \lim_{j \rightarrow \infty} c_{nj} = 0$ : Clear, since we have  $c_{nj} = 0, \forall j \geq n$ .
2.  $\lim_{n \rightarrow \infty} c_{nj} = 0$  uniformly in  $j$ : This is also easy to see, because we have  $|a_n x^j \alpha^{n-1-j}| \leq |a_n| \rightarrow 0$  unrelated to  $j$ .

So we can switch the sums and then we have

$$(x - \alpha) \sum_{n=0}^{\infty} \sum_{j=0}^{\infty} c_{nj} = (x - \alpha) \sum_{j=0}^{\infty} \sum_{n=0}^{\infty} c_{nj}$$

since  $\forall j \geq n : c_{nj} = 0$ , we need to only consider when  $n > j$  so its equal to

$$\begin{aligned} &= (x - \alpha) \sum_{j=0}^{\infty} \sum_{n=j+1}^{\infty} a_n x^j \alpha^{n-1-j} = (x - \alpha) \sum_{j=0}^{\infty} x^j \underbrace{\sum_{n=0}^{\infty} a_{n+j+1} \alpha^n}_{=: b_j} \\ &= (x - \alpha) g(x), \quad g(x) := \sum_{j=0}^{\infty} b_j x^j \end{aligned}$$

**Corollary 2.4.** *Let  $f(X) = \sum a_n x^n$  be a non-zero power series which converges on  $\mathbb{Z}_p$ , and let  $\alpha_1, \dots, \alpha_m \in \mathbb{Z}_p$  be the roots of  $f(X)$  in  $\mathbb{Z}_p$ , then there exists another power series  $g(X)$  which also converges on  $\mathbb{Z}_p$  but has no zeros in  $\mathbb{Z}_p$ , for which*

$$f(X) = \left( \prod_{i=1}^m (X - \alpha_i) \right) g(X)$$

*Proof.*

□

**Corollary 2.5.** *Let  $f(X) = \sum a_n x^n$  be a non-zero power series which converges on  $p^m \mathbb{Z}_p$ , for some  $m \in \mathbb{Z}$ . Then  $f(X)$  has a finite number of roots in  $p^m \mathbb{Z}_p$ .*

*Proof.*

□

**Corollary 2.6.** *Let  $f(X) = \sum a_n x^n$  and  $g(X) = \sum b_n x^n$  be two  $p$ -adic power series which converge in a disc  $p^m \mathbb{Z}_p$ . If there exist infinitely many numbers  $\alpha \in p^m \mathbb{Z}_p$  such that  $f(\alpha) = g(\alpha)$ , then  $a_n = b_n, \forall n \geq 0$*

*Proof.*

□

**Corollary 2.7.** *Let  $f(X) = \sum a_n x^n$  be a  $p$ -adic power series which converges in some disc  $p^m \mathbb{Z}_p$ . If the function  $p^m \mathbb{Z}_p \rightarrow \mathbb{Q}_p, x \mapsto f(x)$  is periodic, that is,  $\exists \pi \in p^m \mathbb{Z}_p : f(x + \pi) = f(x), \forall x \in p^m \mathbb{Z}_p$  then  $f(X)$  is constant.*

*Proof.*

□

**Corollary 2.8.** *Let  $f(X) = \sum a_n x^n$  be a  $p$ -adic power series which is entire, that is,  $f(x)$  converges  $\forall x \in \mathbb{Q}_p$ . Then  $f(X)$  has at most countably many zeros. Furthermore, if the set of zeros is not finite then the zeros form a sequence  $\alpha_n$  with  $|\alpha_n| \rightarrow \infty$ .*

*Proof.*
